

STOP THE SPREAD OF MRSA

Methicillin-resistant Staphylococcus aureus (MRSA) is a bacteria that causes infections in different parts of the body. It's tougher to treat than most strains of staphylococcus aureus – or staph – because it's resistant to some commonly used antibiotics.

how does it spread

MRSA (Methicillin-resistant Staphylococcus aureus) usually spreads from person to person through hands or close, skin-to-skin contact. Drainage from an infected wound can spread MRSA to other parts of the body or to other persons. We are all at risk for getting a MRSA infection, because MRSA can live on the skin and survive on some surfaces for prolonged periods of time.

what can you do

- Wash your hands often (for at least 30 seconds)
- Use alcohol-based sanitizing gel
- Clean & disinfect high-touch surfaces, shared items and equipment (counters, door knobs, sports equipment, toys)
- Do not share personal hygiene items
- Keep wounds clean and covered with a dry bandage.

prepare your school, workplace, home

SANITIZE & CLEAN

Stoko Gel Instant Hand Sanitizer

Instant hand sanitizer that kills 99.99% of common germs that can cause disease, including Staphylococcus Aureus MRSA. It also contains a conditioner to prevent skin from drying out. Sanitizes hands without water.
